Workout App: MyStride

Cameron Fox

March 2026

1 Introduction

This project focuses on developing a fitness application designed to help users achieve their personal fitness goals. These goals may include losing weight, gaining weight, building muscle, or improving overall fitness. The application aims to support users in reaching these goals in a healthy and structured way by providing clear progress tracking and goal visualization.

2 Features

The following features are planned for the final version of the application:

- User accounts that store basic personal information locally on the device
- The ability to log and store individual workouts on the device
- Workout progress displayed through both text and visual graphs to show progress toward goals
- Custom goals that can be set for individual workouts
- Body weight tracking with visual progress graphs
- Daily and weekly step counts retrieved from the Apple Health application
- Daily and weekly walking distance retrieved from the Apple Health application
- Photo storage to allow users to compare past and current progress photos
- A daily workout tracker displayed as a heatmap, similar to GitHub's contribution tracker
- The ability to upload or create personalized workout plans and assign them to specific days

3 Purpose

Many fitness applications rely on complex training plans or require users to store their personal data on external servers. This application is designed to provide a simpler and more private approach to tracking fitness progress.

The primary goal of the application is to provide users with a clear and motivating view of their progress by tracking workouts, body metrics, and progress photos. All data will be stored locally on the device, allowing users to maintain full control over their personal information.

Unlike many fitness applications, this app will not generate its own workout programs. Instead, its purpose is to provide a flexible tracking system that allows users to pursue their fitness goals in whatever way best fits their individual needs.

4 Target Users

This application is intended for individuals who want a simple and private way to track their fitness progress.

Examples of potential users include:

- Individuals working toward weight loss or weight gain
- Athletes returning to training after time away from fitness
- Individuals focused on building muscle or improving strength
- Users who prefer keeping personal data stored locally rather than online

5 System Overview

The application will be developed for iOS using Swift and SwiftUI. All user data will be stored locally on the device.

The system will consist of several primary components:

- User profile management
- Workout logging and tracking
- Progress visualization using graphs and charts
- Integration with Apple Health for step count and walking distance
- Progress photo storage and comparison

6 Functional Requirements

The application must:

- Allow users to create and edit a personal profile
- Allow users to log workouts and store them locally on the device
- Display workout progress through visual graphs
- Allow users to create and manage goals for specific workouts
- Track body weight over time
- Import step count and walking distance data from Apple Health
- Allow users to upload and compare progress photos
- Display a daily workout heatmap
- Allow users to upload or create personalized workout plans

7 Non-Functional Requirements

- The application must run smoothly on modern iOS devices
- All personal data must remain stored locally on the device
- The user interface must be simple, intuitive, and easy to navigate
- Graphs and visualizations should update automatically when new data is added

8 Security Requirements

The application must meet the following security and privacy requirements:

- All user data must be stored locally on the device
- The application will not provide medical or health advice
- The application may provide simple reminders (such as drinking water or completing workouts)
- No artificial intelligence systems will be included in the application

9 Future Improvements

Potential future features include:

- Cloud backup support
- Social features for sharing progress with friends
- Expanded workout analytics
- Custom workout recommendations
